PEARL SOFTWARE RELEASES BETA VERSION OF PEARL ECHO 12

Pearl Software unveils Echo Crypto.View™

Exton, PA – December 2, 2015 - Pearl Software has released a preview of its latest Employee Internet monitoring and web filtering products with the highly anticipated release of Version 12. Pearl's latest offering includes the ability to safely monitor and control encrypted data transfer with minimal overhead and without the use of complicated proxy servers or Internet traffic redirection. Its new release also includes Echo Smart.Capture™ which reduces monitoring and storage of non-pertinent user web activity.

"We set out to be able to manage secure Internet traffic – web, e-mail, etc. – without compromising data security in any way," said Pearl Software CTO, Joe Field. "As in all of our products, Pearl Echo's monitoring and control technology works at the Internet protocol level; this enables customers to use any Internet application they desire. In addition, our newest technology, Echo Crypto.View™, is able to inspect and manage the content of encrypted communications while that data is resident on the endpoint and not traversing the network." Given the amount of data transfer in Web 2.0 and HTML-5, Pearl Software's latest version includes additional data compression and optimized memory management achieving over 85% reduction in stored web usage data.

Pearl Software's Internet monitored and filtering products are used across multiple areas including e-mail, web surfing, file transfers, news resource access, instant messaging and chat. Pearl Software assists organizations with single or multiple locations as well as entities that have roaming and mobile Internet users. The software's patented mobility technology is an ideal tool for organizations that want their policies for Internet use to cover not only their internal network but also to extend beyond it.

About Pearl Software

Pearl Software of Exton, Pa., was founded in 1996 and is a leader in the development of patented Internet monitoring and web filtering software that is used by companies, government agencies, schools, hospitals and other public and private entities around the world. Its products are designed to provide network administrators with tools to monitor employee Internet usage and protect their networks from internal and external threats.
